

Arrange rain screen walls, which is the way you prevent any moisture from going into the building. There is a moisture break behind the product (a membrane) that stops water from entering the product. There is a 3/4" air space in between the rain screen wall and the Eco-Cem™; there is an air gap and that allows moisture to dry out. Eco-Cem™ is fastened through with stainless steel fasteners onto the rain screen wall and the air spaces in between.
